Project Brief: TODO List App

Oct 13, 2026 · @Stokley Onuba

Overview

By Friday, you will turn your hi-fi TODO List mockups into a real, working app, deployed live, and present it to the class.

You already designed it: 3 mobile screens, 1 desktop screen, and at least one experimental feature you won't find in a typical to-do app. This week you build it with HTML, CSS, and vanilla JavaScript, using everything from Weeks 1 through 4.

The goal is a **finished, polished app that does a few things well**, not a half-built app that tries to do everything.

Week at a glance

Day	Focus	Checkpoint by end of class
Tuesday	Scope, repo setup, start building	Scope approved, repo deployed to GitHub Pages, tasks rendering from a data array
Wednesday	Core features	Add, complete, delete, and filter all working
Thursday	Experimental feature, states, styling	Experimental feature working, empty/loading/error states done, matches mockups on mobile and desktop
Friday	Polish, then present	Final push, README done, presentation

If you're behind a checkpoint, cut scope rather than staying up all night. Talk to an instructor.

Requirements

MVP (must-have)

Data and logic

- All tasks live in an array of objects in JavaScript, with no hardcoded `<li>`s in your HTML
- A `render` function that draws the list from the data array
- Add a task with a form, using `preventDefault` and validation (no empty tasks, with a visible error message)
- Mark a task complete, shown visually with a `classList` toggle
- Delete a task using **event delegation**
- Filter tasks (for example All / Active / Completed) using `filter`
- A computed summary using `reduce` or a loop (for example "3 tasks left")

Design

- Matches your hi-fi mockups on mobile and desktop
- Design system as CSS variables: color palette, type scale, spacing scale
- Hover and active states on every button and interactive element
- Empty state, loading state (can be simulated with `setTimeout`), and error state

Experimental feature (required: at least one)

Build **one** experimental feature from your mockups. Pick the smallest one if you designed several. If your favorite is too big for this week, an instructor will help you cut it down to a version you can finish by Thursday.

Process

- Work on feature branches, merged through pull requests
- At least 12 meaningful commits
- A README with the project description, features, how to use it, and links

Stretch goals

Only start these once every MVP item works and is deployed.

- Edit a task in place
- Sort tasks (by date added, due date, priority, or name)
- Search tasks by text
- Due dates or priority levels
- Categories or tags

- Dark mode toggle using your CSS variables
- A second experimental feature from your mockups

Scoping rules

Everyone overbuilds their first project. The features always look small in Figma and turn out big in code, and the last 10% (bugs, styling, edge cases) takes far longer than expected.

1. **MVP first, always.** Build every must-have, deploy it, then add anything extra.
2. **One experimental feature, kept small.** Ask: what is the simplest version that still shows the idea?
3. **Deploy on day one.** Push a bare page to GitHub Pages tonight so deployment never surprises you on Friday.
4. **When behind, cut, don't cram.** A smaller app that works beats a bigger one that breaks during your demo.
5. **Your mockups are the target, not a contract.** If a design detail costs hours, simplify it and note the change in your README.

Deliverables

Submit these before Friday's presentations:

- [ ] Live link (GitHub Pages)
- [ ] Repo link
- [ ] Figma link (with your hi-fi mockups)
- [ ] README covering the description, features, your experimental feature, how to use the app, and any changes from the mockups

Friday presentation format

Each presentation is **5 minutes**, plus 1–2 minutes of questions. Present from your live link, not your local files.

Time	What to cover
1 min	Who it's for: one user story and what makes your app different
2 min	Live demo: add, complete, filter, and delete a task
1 min	Your experimental feature: what it does and why you built it
1 min	Your biggest challenge and how you solved it, or what you'd build next

Have a backup: a screenshot or short screen recording of your app working, in case something breaks live.

Grading rubric

Category	Points
Data array + render function, no hardcoded list items	10
Add with form, `preventDefault`, and validation	10
Complete toggle + delete with event delegation	10
Filter + computed summary	10
Experimental feature works	15
Matches mockups on mobile and desktop	15
Design system as CSS variables + hover and active states	10
Empty, loading, and error states	5
Feature branches + PRs, 12+ commits	5
README + all links submitted	5
Friday presentation	5
Total	**100**
